Preface	xv
Acknowledgements	xvii
Abbreviations	xix
Notation	xxi
1 Introduction	1
1.1 Extreme events	1
1.2 The portfolio construction problem	2
1.3 Coping with really extreme events	2
1.4 Risk budgeting	3
1.5 Elements designed to maximise benefit to readers	4
1.6 Book structure	4
2 Fat Tails – In Single (i.e., Univariate) Return Series	7
2.1 Introduction	7
2.2 A fat tail relative to what?	7
2.3 Empirical examples of fat-tailed behaviour in return series	11
2.3.1 Introduction	11
2.3.2 Visualising fat tails	11
2.3.3 Behaviour of individual bonds and bond indices	17
2.3.4 Behaviour of equity indices	17
2.3.5 Currencies and other asset types	22
2.4 Characterising fat-tailed distributions by their moments	23
2.4.1 Introduction	23
2.4.2 Skew and kurtosis	25
2.4.3 The (fourth-moment) Cornish-Fisher approach	26
2.4.4 Weaknesses of the Cornish-Fisher approach	27
2.4.5 Improving on the Cornish-Fisher approach	28
2.4.6 Statistical tests for non-Normality	29
2.4.7 Higher order moments and the Omega function	31

2.5	What causes fat tails?	32
2.5.1	Introduction	32
2.5.2	The Central Limit Theorem	33
2.5.3	Ways in which the Central Limit Theorem can break down	34
2.6	Lack of diversification	35
2.7	A time-varying world	36
2.7.1	Introduction	36
2.7.2	Distributional mixtures	37
2.7.3	Time-varying volatility	38
2.7.4	Regime shifts	40
2.8	Stable distributions	41
2.8.1	Introduction	41
2.8.2	Defining characteristics	42
2.8.3	The Generalised Central Limit Theorem	44
2.8.4	Quantile–quantile plots of stable distributions	45
2.9	Extreme value theory (EVT)	45
2.9.1	Introduction	45
2.9.2	Extreme value distributions	46
2.9.3	Tail probability densities	47
2.9.4	Estimation of and inference from tail index values	47
2.9.5	Issues with extreme value theory	47
2.10	Parsimony	50
2.11	Combining different possible source mechanisms	52
2.12	The practitioner perspective	53
2.12.1	Introduction	53
2.12.2	Time-varying volatility	53
2.12.3	Crowded trades	53
2.12.4	Liquidity risk	54
2.12.5	‘Rational’ behaviour versus ‘bounded rational’ behaviour	54
2.12.6	Our own contribution to the picture	55
2.13	Implementation challenges	55
2.13.1	Introduction	55
2.13.2	Smoothing of return series	56
2.13.3	Time clocks and non-constant time period lengths	57
2.13.4	Price or other data rather than return data	58
2.13.5	Economic sensitivities that change through time	58
3	Fat Tails – In Joint (i.e., Multivariate) Return Series	61
3.1	Introduction	61
3.2	Visualisation of fat tails in multiple return series	61
3.3	Copulas and marginals – Sklar’s theorem	64
3.3.1	Introduction	64
3.3.2	Fractile–fractile (i.e., quantile–quantile box) plots	66
3.3.3	Time-varying volatility	72
3.4	Example analytical copulas	75
3.4.1	Introduction	75
3.4.2	The Gaussian copula	76

3.4.3	The t -copula	76
3.4.4	Archimedean copulas	78
3.5	Empirical estimation of fat tails in joint return series	78
3.5.1	Introduction	78
3.5.2	Disadvantages of empirically fitting the copula	79
3.5.3	Multi-dimensional quantile–quantile plots	80
3.6	Causal dependency models	83
3.7	The practitioner perspective	83
3.8	Implementation challenges	85
3.8.1	Introduction	85
3.8.2	Series of different lengths	85
3.8.3	Non-coincidentally timed series	86
3.8.4	Cluster analysis	87
3.8.5	Relative entropy and nonlinear cluster analysis	88
4	Identifying Factors That Significantly Influence Markets	91
4.1	Introduction	91
4.2	Portfolio risk models	92
4.2.1	Introduction	92
4.2.2	Fundamental models	94
4.2.3	Econometric models	95
4.2.4	Statistical risk models	96
4.2.5	Similarities and differences between risk models	96
4.3	Signal extraction and principal components analysis	97
4.3.1	Introduction	97
4.3.2	Principal components analysis	99
4.3.3	The theory behind principal components analysis	100
4.3.4	Weighting schemas	102
4.3.5	Idiosyncratic risk	103
4.3.6	Random matrix theory	103
4.3.7	Identifying principal components one at a time	106
4.4	Independent components analysis	106
4.4.1	Introduction	106
4.4.2	Practical algorithms	107
4.4.3	Non-Normality and projection pursuit	109
4.4.4	Truncating the answers	110
4.4.5	Extracting all the un-mixing weights at the same time	110
4.4.6	Complexity pursuit	111
4.4.7	Gradient ascent	112
4.5	Blending together principal components analysis and independent components analysis	112
4.5.1	Introduction	112
4.5.2	Including both variance and kurtosis in the importance criterion	113
4.5.3	Eliminating signals from the remaining dataset	114
4.5.4	Normalising signal strength	115
4.6	The potential importance of selection effects	116
4.6.1	Introduction	116

4.6.2	Quantifying the possible impact of selection effects	116
4.6.3	Decomposition of fat-tailed behaviour	119
4.7	Market dynamics	120
4.7.1	Introduction	120
4.7.2	Linear regression	120
4.7.3	Difference equations	121
4.7.4	The potential range of behaviours of linear difference equations	122
4.7.5	Multivariate linear regression	124
4.7.6	'Chaotic' market dynamics	125
4.7.7	Modelling market dynamics using nonlinear methods	127
4.7.8	Locally linear time series analysis	128
4.8	Distributional mixtures	129
4.8.1	Introduction	129
4.8.2	Gaussian mixture models and the expectation-maximisation algorithm	129
4.8.3	k -means clustering	131
4.8.4	Generalised distributional mixture models	132
4.8.5	Regime shifts	132
4.9	The practitioner perspective	133
4.10	Implementation challenges	134
4.10.1	Introduction	134
4.10.2	Local extrema	135
4.10.3	Global extrema	136
4.10.4	Simulated annealing and genetic portfolio optimisation	137
4.10.5	Minimisation/maximisation algorithms	138
4.10.6	Run time constraints	138
5	Traditional Portfolio Construction Techniques	141
5.1	Introduction	141
5.2	Quantitative versus qualitative approaches?	141
5.2.1	Introduction	141
5.2.2	Viewing any process through the window of portfolio optimisation	142
5.2.3	Quantitative versus qualitative insights	143
5.2.4	The characteristics of pricing/return anomalies	144
5.3	Risk-return optimisation	145
5.3.1	Introduction	145
5.3.2	Mean-variance optimisation	146
5.3.3	Formal mathematical notation	148
5.3.4	The Capital Asset Pricing Model (CAPM)	149
5.3.5	Alternative models of systematic risk	152
5.4	More general features of mean-variance optimisation	152
5.4.1	Introduction	152
5.4.2	Monotonic changes to risk or return measures	152
5.4.3	Constraint-less mean-variance optimisation	153
5.4.4	Alpha-beta separation	153

5.4.5	The importance of choice of universe	154
5.4.6	Dual benchmarks	154
5.5	Manager selection	154
5.6	Dynamic optimisation	156
5.6.1	Introduction	156
5.6.2	Portfolio insurance	157
5.6.3	Stochastic optimal control and stochastic programming techniques	157
5.7	Portfolio construction in the presence of transaction costs	158
5.7.1	Introduction	158
5.7.2	Different types of transaction costs	158
5.7.3	Impact of transaction costs on portfolio construction	159
5.7.4	Taxes	160
5.8	Risk budgeting	161
5.8.1	Introduction	161
5.8.2	Information ratios	162
5.9	Backtesting portfolio construction techniques	163
5.9.1	Introduction	163
5.9.2	Different backtest statistics for risk-reward trade-offs	164
5.9.3	In-sample versus out-of-sample backtesting	166
5.9.4	Backtesting risk models	167
5.9.5	Backtesting risk-return models	169
5.9.6	Transaction costs	169
5.10	Reverse optimisation and implied view analysis	170
5.10.1	Implied alphas	170
5.10.2	Consistent implementation of investment ideas across portfolios	171
5.11	Portfolio optimisation with options	171
5.12	The practitioner perspective	173
5.13	Implementation challenges	174
5.13.1	Introduction	174
5.13.2	Optimisation algorithms	174
5.13.3	Sensitivity to the universe from which ideas are drawn	175
6	Robust Mean-Variance Portfolio Construction	177
6.1	Introduction	177
6.2	Sensitivity to the input assumptions	178
6.2.1	Introduction	178
6.2.2	Estimation error	180
6.2.3	Mitigating estimation error in the covariance matrix	181
6.2.4	Exact error estimates	182
6.2.5	Monte Carlo error estimation	185
6.2.6	Sensitivity to the structure of the smaller principal components	186
6.3	Certainty equivalence, credibility weighting and Bayesian statistics	187
6.3.1	Introduction	187
6.3.2	Bayesian statistics	188
6.3.3	Applying Bayesian statistics in practice	189

6.4	Traditional robust portfolio construction approaches	190
6.4.1	Introduction	190
6.4.2	The Black-Litterman approach	191
6.4.3	Applying the Black-Litterman approach in practice	192
6.4.4	Opinion pooling	193
6.4.5	Impact of non-Normality when using more complex risk measures	193
6.4.6	Using the Herfindahl Hirshman Index (HHI)	194
6.5	Shrinkage	194
6.5.1	Introduction	194
6.5.2	'Shrinking' the sample means	194
6.5.3	'Shrinking' the covariance matrix	196
6.6	Bayesian approaches applied to position sizes	197
6.6.1	Introduction	197
6.6.2	The mathematics	198
6.7	The 'universality' of Bayesian approaches	200
6.8	Market consistent portfolio construction	201
6.9	Resampled mean-variance portfolio optimisation	202
6.9.1	Introduction	202
6.9.2	Different types of resampling	203
6.9.3	Monte Carlo resampling	203
6.9.4	Monte Carlo resampled optimisation <i>without</i> portfolio constraints	206
6.9.5	Monte Carlo resampled optimisation <i>with</i> portfolio constraints	207
6.9.6	Bootstrapped resampled efficiency	208
6.9.7	What happens to the smaller principal components?	208
6.10	The practitioner perspective	208
6.11	Implementation challenges	210
6.11.1	Introduction	210
6.11.2	Monte Carlo simulation – changing variables and importance sampling	211
6.11.3	Monte Carlo simulation – stratified sampling	212
6.11.4	Monte Carlo simulation – quasi (i.e., sub-) random sequences	213
6.11.5	Weighted Monte Carlo	214
6.11.6	Monte Carlo simulation of fat tails	214
7	Regime Switching and Time-Varying Risk and Return Parameters	217
7.1	Introduction	217
7.2	Regime switching	217
7.2.1	Introduction	217
7.2.2	An example of regime switching model	218
7.2.3	The operation of regime switching model	219
7.2.4	Complications	220
7.3	Investor utilities	221
7.3.1	Introduction	221
7.3.2	Expected utility theory	222
7.3.3	Constant relative risk aversion (CRRA)	223
7.3.4	The need for monetary value to be well defined	224

7.4	Optimal portfolio allocations for regime switching models	226
7.4.1	Introduction	226
7.4.2	Specification of problem	226
7.4.3	General form of solution	227
7.4.4	Introducing regime switching	227
7.4.5	Dependency on ability to identify prevailing regime	228
7.4.6	Identifying optimal asset mixes	229
7.4.7	Incorporating constraints on efficient portfolios	229
7.4.8	Applying statistical tests to the optimal portfolios	230
7.4.9	General form of RS optimal portfolio behaviour	230
7.5	Links with derivative pricing theory	231
7.6	Transaction costs	232
7.7	Incorporating more complex autoregressive behaviour	234
7.7.1	Introduction	234
7.7.2	Dependency on periods earlier than the latest one	235
7.7.3	Threshold autoregressive models	235
7.7.4	'Nearest neighbour' approaches	236
7.8	Incorporating more intrinsically fat-tailed behaviour	236
7.9	More heuristic ways of handling fat tails	237
7.9.1	Introduction	237
7.9.2	Straightforward ways of adjusting for time-varying volatility	237
7.9.3	Lower partial moments	238
7.10	The practitioner perspective	240
7.11	Implementation challenges	241
7.11.1	Introduction	241
7.11.2	Solving problems with time-varying parameters	241
7.11.3	Solving problems that have derivative-like elements	242
7.11.4	Catering for transaction costs and liquidity risk	242
7.11.5	Need for coherent risk measures	243
8	Stress Testing	245
8.1	Introduction	245
8.2	Limitations of current stress testing methodologies	246
8.3	Traditional stress testing approaches	247
8.3.1	Introduction	247
8.3.2	Impact on portfolio of 'plausible' but unlikely market scenarios	248
8.3.3	Use for standardised regulatory capital computations	248
8.3.4	A greater focus on what might lead to large losses	250
8.3.5	Further comments	251
8.4	Reverse stress testing	252
8.5	Taking due account of stress tests in portfolio construction	253
8.5.1	Introduction	253
8.5.2	Under-appreciated risks	253
8.5.3	Idiosyncratic risk	253
8.5.4	Key exposures	254
8.6	Designing stress tests statistically	255
8.7	The practitioner perspective	257

8.8	Implementation challenges	258
8.8.1	Introduction	258
8.8.2	Being in a position to ‘stress’ the portfolio	258
8.8.3	Calculating the impact of a particular stress on each position	259
8.8.4	Calculating the impact of a particular stress on the whole portfolio	260
8.8.5	Engaging with boards, regulators and other relevant third parties	261
9	Really Extreme Events	263
9.1	Introduction	263
9.2	Thinking outside the box	263
9.3	Portfolio purpose	265
9.4	Uncertainty as a fact of life	266
9.4.1	Introduction	266
9.4.2	Drawing inferences about Knightian uncertainty	266
9.4.3	Reacting to really extreme events	268
9.4.4	Non-discoverable processes	269
9.5	Market implied data	270
9.5.1	Introduction	270
9.5.2	Correlations in stressed times	271
9.5.3	Knightian uncertainty again	271
9.5.4	Timescales over which uncertainties unwind	272
9.6	The importance of good governance and operational management	272
9.6.1	Introduction	272
9.6.2	Governance models	273
9.6.3	Enterprise risk management	274
9.6.4	Formulating a risk appetite	275
9.6.5	Management structures	276
9.6.6	Operational risk	277
9.7	The practitioner perspective	278
9.8	Implementation challenges	279
9.8.1	Introduction	279
9.8.2	Handling Knightian uncertainty	279
9.8.3	Implementing enterprise risk management	279
10	The Final Word	281
10.1	Conclusions	281
10.2	Portfolio construction principles in the presence of fat tails	281
10.2.1	Chapter 2: Fat tails – in single (i.e., univariate) return series	281
10.2.2	Chapter 3: Fat tails – in joint (i.e., multivariate) return series	282
10.2.3	Chapter 4: Identifying factors that significantly influence markets	283
10.2.4	Chapter 5: Traditional portfolio construction techniques	283
10.2.5	Chapter 6: Robust mean-variance portfolio construction	284
10.2.6	Chapter 7: Regime switching and time-varying risk and return parameters	285
10.2.7	Chapter 8: Stress testing	285
10.2.8	Chapter 9: Really extreme events	285

Appendix: Exercises	287
A.1 Introduction	287
A.2 Fat tails – In single (i.e., univariate) return series	287
A.3 Fat tails – In joint (i.e., multivariate) return series	288
A.4 Identifying factors that significantly influence markets	289
A.5 Traditional portfolio construction techniques	289
A.6 Robust mean-variance portfolio construction	290
A.7 Regime switching and time-varying risk and return parameters	291
A.8 Stress testing	292
A.9 Really extreme events	293
