Acknowledgements	xiii
About the Authors	xv
1 Introduction and Reading Guide	1
2 Binomial Trees	7
2.1 Equities and Basic Options	7
2.2 The One Period Model	8
2.3 The Multiperiod Binomial Model	9
2.4 Black-Scholes and Trees	10
2.5 Strengths and Weaknesses of Binomial Trees	12
2.5.1 Ease of Implementation	12
2.5.2 Oscillations	12
2.5.3 Non-recombining Trees	14
2.5.4 Exotic Options and Trees	14
2.5.5 Greeks and Binomial Trees	15
2.5.6 Grid Adaptivity and Trees	15
2.6 Conclusion	16
3 Finite Differences and the Black-Scholes PDE	17
3.1 A Continuous Time Model for Equity Prices	17
3.2 Black-Scholes Model: From the SDE to the PDE	19
3.3 Finite Differences	23
3.4 Time Discretization	27
3.5 Stability Considerations	30
3.6 Finite Differences and the Heat Equation	30
3.6.1 Numerical Results	34
3.7 Appendix: Error Analysis	36
4 Mean Reversion and Trinomial Trees	39
4.1 Some Fixed Income Terms	39
4.1.1 Interest Rates and Compounding	39
4.1.2 Libor Rates and Vanilla Interest Rate Swaps	40

4.2	Black76 for Caps and Swaptions	43
4.3	One-Factor Short Rate Models	45
4.3.1	Prominent Short Rate Models	45
4.4	The Hull-White Model in More Detail	46
4.5	Trinomial Trees	47
5	Upwinding Techniques for Short Rate Models	55
5.1	Derivation of a PDE for Short Rate Models	55
5.2	Upwind Schemes	56
5.2.1	Model Equation	57
5.3	A Puttable Fixed Rate Bond under the Hull-White One Factor Model	63
5.3.1	Bond Details	64
5.3.2	Model Details	64
5.3.3	Numerical Method	65
5.3.4	An Algorithm in Pseudocode	68
5.3.5	Results	69
6	Boundary, Terminal and Interface Conditions and their Influence	71
6.1	Terminal Conditions for Equity Options	71
6.2	Terminal Conditions for Fixed Income Instruments	72
6.3	Callability and Bermudan Options	74
6.4	Dividends	74
6.5	Snowballs and TARNs	75
6.6	Boundary Conditions	77
6.6.1	Double Barrier Options and Dirichlet Boundary Conditions	77
6.6.2	Artificial Boundary Conditions and the Neumann Case	78
7	Finite Element Methods	81
7.1	Introduction	81
7.1.1	Weighted Residual Methods	81
7.1.2	Basic Steps	82
7.2	Grid Generation	83
7.3	Elements	85
7.3.1	1D Elements	86
7.3.2	2D Elements	88
7.4	The Assembling Process	90
7.4.1	Element Matrices	93
7.4.2	Time Discretization	97
7.4.3	Global Matrices	98
7.4.4	Boundary Conditions	101
7.4.5	Application of the Finite Element Method to Convection-Diffusion-Reaction Problems	103
7.5	A Zero Coupon Bond Under the Two Factor Hull-White Model	105
7.6	Appendix: Higher Order Elements	107
7.6.1	3D Elements	109
7.6.2	Local and Natural Coordinates	111

8 Solving Systems of Linear Equations	117
8.1 Direct Methods	118
8.1.1 Gaussian Elimination	118
8.1.2 Thomas Algorithm	119
8.1.3 LU Decomposition	120
8.1.4 Cholesky Decomposition	121
8.2 Iterative Solvers	122
8.2.1 Matrix Decomposition	123
8.2.2 Krylov Methods	125
8.2.3 Multigrid Solvers	126
8.2.4 Preconditioning	129
9 Monte Carlo Simulation	133
9.1 The Principles of Monte Carlo Integration	133
9.2 Pricing Derivatives with Monte Carlo Methods	134
9.2.1 Discretizing the Stochastic Differential Equation	135
9.2.2 Pricing Formalism	137
9.2.3 Valuation of a Steepener under a Two Factor Hull-White Model	137
9.3 An Introduction to the Libor Market Model	139
9.4 Random Number Generation	146
9.4.1 Properties of a Random Number Generator	147
9.4.2 Uniform Variates	148
9.4.3 Random Vectors	150
9.4.4 Recent Developments in Random Number Generation	151
9.4.5 Transforming Variables	152
9.4.6 Random Number Generation for Commonly Used Distributions	155
10 Advanced Monte Carlo Techniques	161
10.1 Variance Reduction Techniques	161
10.1.1 Antithetic Variates	161
10.1.2 Control Variates	163
10.1.3 Conditioning	166
10.1.4 Additional Techniques for Variance Reduction	168
10.2 Quasi Monte Carlo Method	169
10.2.1 Low-Discrepancy Sequences	169
10.2.2 Randomizing QMC	174
10.3 Brownian Bridge Technique	175
10.3.1 A Steepener under a Libor Market Model	177
11 Valuation of Financial Instruments with Embedded American/Bermudan Options within Monte Carlo Frameworks	179
11.1 Pricing American options using the Longstaff and Schwartz algorithm	179
11.2 A Modified Least Squares Monte Carlo Algorithm for Bermudan Callable Interest Rate Instruments	181
11.2.1 Algorithm: Extended LSMC Method for Bermudan Options	182
11.2.2 Notes on Basis Functions and Regression	185

11.3	Examples	186
11.3.1	A Bermudan Callable Floater under Different Short-rate Models	186
11.3.2	A Bermudan Callable Steeper Swap under a Two Factor Hull-White Model	188
11.3.3	A Bermudan Callable Steeper Cross Currency Swap in a 3D IR/FX Model Framework	189
12	Characteristic Function Methods for Option Pricing	193
12.1	Equity Models	194
12.1.1	Heston Model	196
12.1.2	Jump Diffusion Models	198
12.1.3	Infinite Activity Models	199
12.1.4	Bates Model	200
12.2	Fourier Techniques	201
12.2.1	Fast Fourier Transform Methods	201
12.2.2	Fourier-Cosine Expansion Methods	203
13	Numerical Methods for the Solution of PIDEs	209
13.1	A PIDE for Jump Models	209
13.2	Numerical Solution of the PIDE	210
13.2.1	Discretization of the Spatial Domain	211
13.2.2	Discretization of the Time Domain	211
13.2.3	A European Option under the Kou Jump Diffusion Model	212
13.3	Appendix: Numerical Integration via Newton-Cotes Formulae	214
14	Copulas and the Pitfalls of Correlation	217
14.1	Correlation	218
14.1.1	Pearson's ρ	218
14.1.2	Spearman's ρ	218
14.1.3	Kendall's τ	220
14.1.4	Other Measures	221
14.2	Copulas	221
14.2.1	Basic Concepts	222
14.2.2	Important Copula Functions	222
14.2.3	Parameter estimation and sampling	229
14.2.4	Default Probabilities for Credit Derivatives	234
15	Parameter Calibration and Inverse Problems	239
15.1	Implied Black-Scholes Volatilities	239
15.2	Calibration Problems for Yield Curves	240
15.3	Reversion Speed and Volatility	245
15.4	Local Volatility	245
15.4.1	Dupire's Inversion Formula	246
15.4.2	Identifying Local Volatility	246
15.4.3	Results	247
15.5	Identifying Parameters in Volatility Models	248
15.5.1	Model Calibration for the FTSE-100	249

16 Optimization Techniques	253
16.1 Model Calibration and Optimization	255
16.1.1 Gradient-Based Algorithms for Nonlinear Least Squares Problems	256
16.2 Heuristically Inspired Algorithms	258
16.2.1 Simulated Annealing	259
16.2.2 Differential Evolution	260
16.3 A Hybrid Algorithm for Heston Model Calibration	261
16.4 Portfolio Optimization	265
17 Risk Management	269
17.1 Value at Risk and Expected Shortfall	269
17.1.1 Parametric VaR	270
17.1.2 Historical VaR	272
17.1.3 Monte Carlo VaR	273
17.1.4 Individual and Contribution VaR	274
17.2 Principal Component Analysis	276
17.2.1 Principal Component Analysis for Non-scalar Risk Factors	276
17.2.2 Principal Components for Fast Valuation	277
17.3 Extreme Value Theory	278
18 Quantitative Finance on Parallel Architectures	285
18.1 A Short Introduction to Parallel Computing	285
18.2 Different Levels of Parallelization	288
18.3 GPU Programming	288
18.3.1 CUDA and OpenCL	289
18.3.2 Memory	289
18.4 Parallelization of Single Instrument Valuations using (Q)MC	290
18.5 Parallelization of Hybrid Calibration Algorithms	291
18.5.1 Implementation Details	292
18.5.2 Results	295
19 Building Large Software Systems for the Financial Industry	297
Bibliography	301
Index	307
